

How climate change could affect Grimsby and Humberside

This effect can make Grimsby and the Humber FLOOD, because of **CLIMATE CHANGE** melting up the ice from North pole, South pole and Greenland making more water making sea levels RISE . more than 1,000,000 homes will be destroyed .

Current affect of climate change

CLIMATE CHANGE is created by people littering the world ;
sewage water dumped into the water, plastic and metals are
HURTING ANIMALS IN THE OCEAN ...!

Pollution

The **POLLUTION** in the air is from factories , factories are pumping Co2 (carbon dioxide) into the the air putinga layer of Co2 into the atmosphere making holes in the shield , when there's holes in the shield the sunlight will go

through the holes and back up but the rest of the shield will reflect back to earth.

Future predictions

If this keeps up the whole entire world will be a pool of water, maybe a few bits of land but **everywhere will be flooded in 2050 ...!!!:(**

Climate in Nigeria !

Nigeria's climate has been changing, increases in temperature; rise in sea level and flooding; people are dying because of the flooding ; land degradation; more frequent extreme weather events; affected fresh water and rainfall have increased, producing large runoffs and flooding in many places in Nigeria.

Injuries in Nigeria

People are dying or being injured because of floods in Nigeria drowning people and extreme weather events .
